Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Reprod. Dev. 34:1-7(1993).

-!- FUNCTION: ONE OF THE FIRST GENES TO BE TRANSCRIBED DURING MOUSE DEVELOPMENT, MAY PLAY SOME GENERAL FUNCTION.

-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).

-!- DEVELOPMENTAL STAGE: TRANSCRIBED DURING EARLY MOUSE DEVELOPMENT.

-!- DEVELOPMENTAL STAGE: TRANSCRIBED DURING EARLY MOUSE DEVELOPMENT.

-!- DEVELOPMENTAL STAGES FROM THE BGG THROUGH THE BLASTOCYT, MOST ABUNDANT AT THE 2-CELL STAGES.

-!- SIMILARITY: Belongs to the Mo25 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Wu X., Graves T., Bradshaw H.;
Submitted (SEP-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Binds to type II regulatory subunits of protein kinases
A. Scaffolding protein that assembles several protein kinases and
phosphatases on centrosome and Golgi apparatus where physiological
events can be regulated by phosphorylation state of protein
substrates. Isoform 4/Yotiao is associated with the N-methyl-D-
aspartate receptor and is specifically found in the neuromuscular
junction (NMJ) as well as in neuronal synapses explaining that its
role may be to organize postsynaptic specializations.

-!- SUBMINT: Interacts with the regulatory region of protein kinase N
(FKN), protein phosphatase 2A (FP2A), protein phosphatase I (FPI)
and the immature non-phosphorylated form of PKC epsilon.

-!- SUBGELLUAR (CONTIONAL)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. Isoform 4/Yotiao is highly expressed in skeletal muscle and in pancreas.
-:- DOMAIN: RIL-binding site, predicted to form an amphipathic helix, could participate in protein-protein interactions with a complementary surface on the R-subunit dimer.
-:- CAUTION: Ref. 6 sequence differs from that shown due to two frameshifts in positions 3782 and 3811.
-:- CAUTION: Ref. 9 sequence differs from that shown due to four frameshifts in positions 29, 1653, 1699 and 1735.

Corley NC, Gorgone GA; Guegler KJ, Tang YT,

WPI; 2000-387793/33. N-PSDB; AAA27332 Human hCBP protein, and the nucleic acid encoding it, useful for e.g. diagnosis, prevention and treatment of cancers, immune, developmental or reproductive disorders.

Claim 1; Fig 1; 72pp; English.

The present sequence is the human calcium binding protein hCBP. It was obtained by screening a coronary artery smooth muscle cDNA library, from which five overlapping nucleic acids were isolated, sequenced and expressed to give the protein. The protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defects, endometriosis, disruptions of the oestrus and menstrual cycles, polycystic overy syndrome and overian hyperstimulation), autoimmune disorders (such as benign prostatic hyperplasia and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and gonadal dysgenesis), hereditary

                          The present sequence is the protein sequence for human Acute Neuronal Induced Calcium Binding Protein (ANIC-BP). ANIC-BP coding sequence and protein are useful for treating stroke, acute head trauma, multiple sclerosis and spinal cord injury. ANIC-BP coding sequence and protein are also useful as vaccines for inducing an immunological response in a

The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral neuropaths of the invention may be used to treat diseases of the peripheral neuropaths of the invention may be used to treat diseases of the peripheral neuropaths of contains and central nervous singuries, speem disease, such as alzaeinsed neuropathies and central nervous system disease, such as alzaeins as peripheral neuropaths and central nervous system disease, such as takeral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, cancer is immune system suppression, activity cancer diseases and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C. N. S disorders. Note: The sequence data for this patent did not form part of the printed specification

the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in particularly. The primers are useful for synthesising polynucleotides, particularly full-length DNMs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNMs. The primers allow obtaining of the full-length cDNMs easily without any specialised methods. AMH03166 to AMH13628 and AMH13631 to AMH13621 represent human amino acid sequences; and AMH13629 to AMH13632 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes primer sets for synthesising 5602 full-length CDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide complementary to the nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence of on oligonucleotide comprises a 3'-end sequence of only properties and an oligonucleotide sequence and an oligonucleotide sequence of on oligonucleotide objectides also sequence of on oligonucleotide objectides at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       49 MKEILCGTNEKEPPTEAVAQLAQELYSSGLLVTLIADLQLIDFEGKKDVTQIFNNILRRQ 108
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            168
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           121 FKYVELSTFDIASDAFATFKDLLTRHKVLVADFLEQNYDTIFEDYEKLLQSENYVTKRQS 180

The invention relates to human acute neuronal induced calcium-binding protein (ANIC-BP) and to nucleic acid encoding it. The invention also relates to expression systems and recombinant host cells comprising ANIC-BP DNA, the recombinant production of ANIC-BP, antibodies specific for ANIC-BP, fusion proteins comprising ANIC-BP and immunoglobulin FC region, and methods of screening for modulators of ANIC-BP function. ANIC-BP has homology and structural similarity to HymA and MoS2 proteins. ANIC-BP proteins and nucleotides are useful for treating stroke and acute head trauma, multiple sclerosis and spinal cord injury. ANIC-BP proteins are useful in screening assays, for identifying membrane bound or soluble receptors, and also in vaccines. MIC-BP nucleotides are useful as diagnostic reagents, as tools for tissue expression studies, for chromosome localisation studies, and in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel acute neuronal induced calcium binding protein, useful for treating acute head trauma, stroke, multiple sclerosis and spinal cord injury.

protein type 1 (ANIC-BP-1) ligand polypeptides and polynucleotides. Sequences of the invention are useful for treating human diseases including stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord injury. They are also useful as vaccines. ANIC-BP-1 ligands are useful for identifying membrane bound soluble receptors. Polynucleotides of the invention are useful as diagnostic reagents, for chromosome localization studies, and as valuable tools for tissue expression studies. They are also useful in gene therapy. The present sequence is Gal4-human ANIC-BP-1 fusion protein comprising the Gal4 protein and a C-terminally linked human ANIC-BP-1

The invention relates to human acute neuronal induced calcium binding protein type 1 (ANIC-BP-1) ligand polypeptides and polynucleotides. Sequences of the invention are useful for treating human diseases including stroke, head trauma, multiple sclerosis, Parkinson's disease, Alzheimer's disease and spinal cord injury. They are also useful as vaccines. ANIC-BP-1 ligands are useful for identifying membrane bound soluble receptors. Polynucleotides of the invention are useful as diagnostic reagents, for chromosome localization studies, and as valuable tools for tissue expression studies. They are also useful in gene therapy. The present sequence is LexA-human ANIC-BP-1 fusion protein comprising the LexA protein and a C-terminally linked human ANIC-BP-1
                                                                                                                                                                                                                                                                                                           3

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WHOO at the printed specification, but was obtained in electronic format directly from WHOO at

```
The present sequence is that of a novel human acute neuronal induced calcium binding protein-like protein splice variant, ANIC-NP-1B. The protein shows homology to other members of the calcium binding protein family, including ANIC-BP, a protein discovered by mRNA differential display that is upregulated in a rat model of head trauma. ANIC-BP and ANIC-BP-1B differ in their C-terminal pottions. The variant protein could serve as a novel drug target. The invention provides ANIC-BP-1B polynucleotides (see AAF19688) and polypeptides, expression vectors, host cells and antibodies, as well as methods for producing the protein and cortism or preventing disorders associated with expression of the protein by inhibiting or activating the action of ANIC-BP-1B. Diseases that may be treated include stroke and acute head trauma, Parkinson's disease, Alzheimer's disease, multiple sclerosis and spinal cord injury. The polynucleotides and polypeptides can also be used in disgnostic assays and in vaccines, and to identify agonists and antagonists useful for treating conditions associated with ANIC-BP-1B imbalance
                                                                                                                                                                                            Acute neuronal induced calcium binding protein; ANIC-BP-1B; spice variant; human; stroke; head trauma; Parkinson's disease; Alzheimer's disease; multiple sclerosis; spinal cord injury; cerebroprotective; antiparkinsonian; nootropic; neuroprotective; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human acute neuronal induced calcium-binding protein like protein splice variant, useful for treating stroke, acute head trauma, Parkinson's disease, Alzheimer's disease multiple sclerosis, spinal cord
                                                                                                                                                       Human acute neuronal induced calcium binding protein ANIC-BP-1B.

                                                                                                                                The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Wang D;

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                         171 YVELSTFDIASDAFATFKDLITRHKVLVADFLEQNYDTIFEDYEKLLQSENYVTKRQSLK 230

Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic thateral scalerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhishin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

                                                                                                                                                                                                                                       or
insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABB57737-ABR72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence is the Drosophila calcium binding protein DW025. It was used in a sequence alignment to identify human calcium binding protein hCDP. The hCDP protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defects, endometriosis, disruptions of the oestrus and menstrual cycles, polycystic ovary syndrome and ovarian hyperstimulation), autoimmune disorders (such as benign prostatic hyperstimulation), autoimmune disorders (such as benign prostatic or hyperplasia and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and gonadal dysgenesis), hereditary neuropathies, estaure disorders, immune disorders (such as AIDS, allergies, anaemia, asthma atheroscalerosis, cholecystitis, Crohn's disease, diabetes, Graves' disease, multiple sclerosis, psoriasis, chleuris), and viral, bacterial, fungal, parasitic, protozoal and helminthic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

                                                                                                                                                                                                                                           The present sequence is the C. elegans yeast-like CBP. It was used in a sequence alignment to identify human calcium binding protein hCBP. The hCBP protein and the gene encoding it are useful for the diagnosis and treatment of the following types of disorder: cancers (such as adenocarcinomas), reproductive disorders (such as infertility, ovulatory defects, endometriosis, disruptions of the osetrus and menstrual cycles, polycystic ovary syndrome and ovarian hyperstimulation), autoimmune disorders (such as benign prostatic hyperplasis and prostatitis), developmental disorders (such as Cushing's syndrome, muscular dystrophy and gondal dysgensis), hereditary neuropathies, seizure disorders, immune disorders (such as ALDS, allergies, anaemia, asthma, attherosclerosis, cholecystitis, Crohn's disease, diabetes, Graves' disease, multiple sclerosis, psoriasis, returnitis,
